 AUTHORS: Litvinenko, L. M., Levchenko, N. P., Anisimov, . N.
 TITLE: Synthesis of Several Nitro and Amino Derivatives of Tolane
 (Sintez nekotorykh nitro- i aminoproizvodnykh tolana)
 JOURNAL: Zhurnal obshchey khimii, 1958, Vol. 28, Nr 3, pp.2046-2049 (USSR)
 ABSTRACT: Several of the authors' experiments required 4-aminotolane
 (4-aminodiphenylacetylene) and the corresponding 4'-nitro
 derivative, but neither compound was described in the litera-
 ture. A general scheme for synthesizing these compounds for
 the experiments was formulated (R=H or NO₂). As the start-
 ing material compound (I), R=H, the trans-4-stilbene, was
 used. The intermediate product in this synthesis scheme, the
 4-nitrotolane, was also previously unknown. As an inter-
 esting synthetic peculiarity it was found that of all the
 substances tried for the reduction, Na₂S₂ (NH₄)₂S, H₂S in
 pyridine solution, hydrazine hydrate in the presence of a
 nickel catalyst, and others, only that suggested by Ruggli
 (Ruggli, Ref 1), phenylhydrazine, was found to be a valid
 reagent for reducing the 2,2"-dinitrotolane. The presence of

TITLE: System for feeding gas to the ion source of an electrostatic generator

SOURCE: ¹⁹Atomnaya energiya, v. 20, no. 2, 1966, 165-166

TOPIC TAGS: valve, ion source, electrostatic generator, gas flow

ABSTRACT: In view of certain shortcomings of the presently used leak valves for the admission of gas into electrostatic generators, such as the low capacity (up to 10 cm³/g) and high inertia, making regulation of the current in the electrostatic generator difficult, the authors have developed a new system, consisting of an electromagnetic valve built into the bottle with the gas, and a needle valve. When the electrostatic generator is turned on, the electromagnetic valve is operated and the gas is fed to the needle valve, which regulates the gas flow. Two methods of turning on the electromagnetic valve

Card 1/2

UDC: 539.107.6

L 22737-66

ACC NR: AP6007960

were used, automatic (coupled to the electrostatic-generator belt) and remote (by means of a selsyn). In the case of the automatic control, provision is made to add a resistor to the electromagnetic valve circuit when the electrostatic generator is up to speed. In the case of remote control, the valve is turned on when the voltage control of the electrostatic generator is turned on. Diagrams of the electromagnetic valve and of the needle valve are included. 2727. ANDROSOFF P.I. Munic. Res. Inst. for First Aid, Moscow. * Mechanical angiorrhaphy in the surgical treatment of vascular wounds and traumatic aneurysms VESTN.KHIR. 1955, 75/3 (37-46) Tables 3 Illus. 5 (Russian text)

A group of Soviet doctors and engineers under the direction of constructor W. Gudov have designed an apparatus for a mechanical performance of angiorrhaphy. The suture is done by means of clamps of tantalum wire. The ends of the severed vessel are attached with their intima outwards to bungs of the instrument and then approximated by lever action. The suture is put in position in fractions of a second. At the Sklifossovsky Institute in Moscow the angiorrhaphy was carried out in 26 patients with fresh wounds of the aorta, aa. axillaris and femoralis and other arteries. Twenty-five had a complete recovery. One patient with an injury to the axillary artery developed infection and had to have amputation. By means of the same apparatus angiorrhaphy was performed in 32 patients with traumatic aneurysms. The results were good in 25 of them and fair in the remaining 5. An end-to-end angiorrhaphy is possible with this apparatus even with a separation up to 3-3.5 cm.

6508. ANDROSOV P.I. Sklifosovsky Inst., Moscow. * Blood supply of mobilized intestine used for an artificial esophagus ARCH.SURG. (Chicago) 1956, 73/6 (917-926) illus. 6

Between 1928 and 1955, plastic substitution of the oesophagus was performed in the Sklifosovsky Institute in 696 patients; skin was used in 6 of these, and the colon in 2; in all the other cases the small intestine was used. It was possible to mobilize a section of the small intestine of sufficient length only in 75% of cases. In the remaining 25% of cases failure resulted from the unfavourable disposition of vessels in the mesentery of the mobilized small intestine section. In 1950 a group of engineers and doctors constructed an apparatus for applying vascular sutures to vessels ranging from 1.3 to 15 mm. in diameter. Thereby a new method in plastic surgery was made possible, namely the provision of an additional blood supply for some organ or other by vascular anastomosis. In cases of oesophagoplasty anastomosis between the second radial vessel of the mobilized mesentery of the small intestine and the left internal mammary artery proved to be the most feasible method. It was applied in 11 cases of antethoracic oesophagoplasty. Not a single patient died. There was one failure, when thrombosis of an anastomosis formed as a result of acute vessel sclerosis which ended in necrosis of the upper end of the intestine. On the basis of these experiences the application of a vascular anastomosis between the internal mammary artery and the mesenteric vessel of the mobilized intestine seems undoubtedly to be a very rational method in cases when it is necessary to furnish additional blood to the intestine. In 10 cases of reconstructive oesophagoplastic operations, using small intestine, anastomosis between the mesenteric vessel and the right gastroepiploic artery was applied when the blood supply of the mobilized intestine proved insufficient. The normal blood supply of the intestine was restored in every case. The author also cites a case, in which additional blood supply of the mobilized intestine was effected by connecting its artery with the middle colic artery.

4105. MECHANICAL STITCHING OF URETERS (Russian text) - Androsov
P.I. and Kalinina T.V. - UROL. 1957, 5 (50-52)

Experimental data concerning end-to-end anastomosis of ureters by means of an apparatus for circular stitching used for repair of vessels are discussed. Eight ureters were repaired in this way. Flow of urine was free on the second post-operative day. The edges of the anastomosed ends were apposed correctly without any narrowing of the lumen. Tantalum clips entered only the outer layers of the ureters and did not penetrate into the lumen. (S)

6668. OESOPHAGUS SUBSTITUTION BY COLON PLASTY (Russian Text)
Androsov P. I. - VESTN. KHIR. 1959, 82/2 (9-17) Illus. 4

The personal experience of the author leads him to the conclusion that colon plasty for an artificial oesophagus may be carried out by various methods which depend on the individual case. It is contended that the best colon region to choose for the oesophageal replacement is the ascending colon and the right side of the transverse colon with isoperistalsis. The mobilization of colon for the substitution of oesophagus may yield a better result than that of small intestine, thanks to the more favourable blood supply of the colon, its greater lumen (which makes the junction with the oesophagus and the stomach easier) and absence of numerous coils (the passage of food being thus promoted).
